

Drive – through rack

This design is the same as drive-in rack. The difference is drive- through rack allows life trucks to enter the bays form either end. This considerably increases access to pallet loads, but requires an aisle on both ends of the racking system. Drive-through rack can be loaded from one end and emptied from the other, allowing first-in/first-out(FIFO).

- It is Cost effective.
- High density storage.
- Running into Depth.
- Can drive deep.
- Reduces the need for aisles.
- Drastically increases cubed space utilization.
- Loading & Retrieval from same side (LIFO).
- Loading from one side and retrieval from another side is also possible.
- Maxima space power Drive In storage system is recommended for large volumes storage requirements.
